

UX & UI Audit

codingal.com

Subject	Live homepage (desktop + mobile web)
Audit type	UX + UI + conversion review
Date	2 June 2026
Prepared by	Oli & Hue — GhostBuild
Overall score	5.0 / 10 (credible brand, under-converting homepage)

Executive summary

Codingal has earned trust most edtech brands would envy: a million students, 135 countries, a 4.6/5 parent rating, and backing from Y Combinator, Google and Amazon. The homepage leans on all of it, hard. That is the problem.

The page sells credibility before it explains the product. A parent lands, meets ratings, logos and statistics, and scrolls a long way before understanding what a class is, what their child will build, or what it costs. The result is a visitor who trusts Codingal but cannot picture the experience or the price, and so does not book.

The fix is not more proof. It is to lead with clarity, then back it with proof: show what the child builds and how learning progresses first, then let the substantial trust stack close the deal. Two structural gaps make this worse than ordering alone: pricing is entirely gated, and there is no preview of what a live class looks like. Both are decisive for a parent spending money on a child.

Scoring

Dimension	Score	Note
First-impression clarity (hero)	6 / 10	Strong brand, but the headline is a slogan, not an outcome
Product understanding	4 / 10	What a class is, what's built, how it progresses is unclear
Course discovery	5 / 10	Cards show grade + duration only; no level, age or outcome
Trust & social proof	8 / 10	Abundant, but fragmented and uncontextualised
Pricing transparency	2 / 10	Fully gated behind signup
CTA clarity	5 / 10	Strong primary, but inconsistent labels across the page
Information hierarchy	4 / 10	Proof front-loaded; product buried
Copy quality	6 / 10	Competent but generic in places

UX findings

Severity: **High** = directly costs bookings · **Medium** = adds friction · **Low** = polish.

UX-1 Proof comes before product understanding

High

Problem. The page front-loads ratings, statistics and media logos before answering what this is, what the child will do, and how it works. A parent can finish the first scrolls trusting Codingal yet unable to describe the actual experience.

Fix. Lead with the product. Order: Hero → How It Works → Courses → Student Projects → Teachers → Full Trust → Pricing → Final CTA. Keep only a thin credibility strip (one rating line + three logos) high on the page.

UX-2 No preview of what a class actually is

High

Problem. Codingal sells live 1-on-1 instruction to children aged 5 to 17. The single biggest unanswered question for a parent is what happens in the room, and the homepage never shows it: no class screenshot, no clip, no sample of the teacher-student interaction.

Fix. Add a “What a class looks like” section: one real class screenshot or a 20 to 30 second clip, plus a one-line description of the session flow.

UX-3 Pricing is fully gated

High

Problem. There is no price anywhere on the public site; it surfaces only after registration. For a considered, recurring purchase aimed at cautious parents, hiding price is a larger blocker than any layout issue. It forces a signup commitment before the buyer has the fact they most want.

Fix. Put a pricing anchor on the page. Even a directional “plans from \$X, free trial first, full refund if it's not a fit” removes the biggest source of hesitation. Transparency beats a gate.

UX-4 Course discovery is thin

High

Problem. Course cards display grade range, title and duration only. They omit skill level, recommended age, and the outcome, so a parent cannot self-select confidently.

Fix. Add a level badge (Beginner / Intermediate / Advanced), an age tag, and a one-line outcome to each card. Offer a “not sure? match my child” path into the free trial.

UX-5 Parent objections are never addressed

High

Problem. The real reasons a parent hesitates are specific and emotional: screen time, “is 5 too young,” “what if my child loses interest,” “can I get my money back.” The site has a generic FAQ that does not confront these.

Fix. Rebuild the FAQ around the actual blockers: screen-time framing, age suitability, what happens if the child disengages, exact refund mechanics, device requirements, and why guided 1-on-1 beats free tutorials.

UX-6 Statistics lack context

Medium

Problem. “4.6/5,” “1,000,000+ students,” “Top 1% instructors” are impressive but unsupported, which makes them read as marketing rather than evidence.

Fix. Attach the source to every number: “4.6/5 from 20,000+ parent reviews,” “hired from the top 1% of 50,000+ applicants.” Context turns a claim into proof.

UX-7 Inconsistent CTA strategy

Medium

Problem. The live page mixes “Try a free lesson,” “Sign Up,” “Join class,” and “Try free.” Multiple labels for one action add micro-friction and dilute the primary path.

Fix. One primary CTA everywhere (“Book a free trial class”), one secondary (“See the courses”). No third variant.

UX-8 Dual audience is unmanaged

Medium

Problem. The parent pays; the child uses. These are two people with different triggers, and the page speaks to one at a time without a strategy. The hero is parent-facing; the course art is kid-facing; nothing ties them together.

Fix. Make the split intentional. Parent-facing copy carries the headline, trust, pricing and outcomes. Kid-facing energy lives in the course cards and project showcase. Let the parent see their child wanting it.

UX-9 “How It Works” reads as passive

Low/Medium

Problem. Three disconnected cards describe the process without a sense of progression.

Fix. Connect the three steps visually with a numbered timeline and connectors.

UI findings

UI-1 Layout monotony

Medium

Problem. Most sections repeat heading → paragraph → white card, producing scroll fatigue on an already long page.

Fix. Vary the rhythm: split image/text sections, an image-led project showcase, a timeline, a full-width trust band.

UI-2 Limited visual proof of student work

High

Problem. Very little on the page shows what students actually create. For an outcomes-driven purchase this is the most persuasive visual asset and it is underused.

Fix. Add a prominent “Projects students build” showcase (games, apps, websites, AI projects), ideally clickable, with the child’s grade shown.

UI-3 Logo / media row is crowded

Medium

Problem. Press and partner logos appear cramped and unsized, weakening rather than reinforcing authority.

Fix. Standardise logo height, increase spacing, and group “Backed by” separately from “As seen in.”

UI-4 Weak typographic hierarchy

Medium

Problem. Similar type scale and card styling across sections means important content competes with secondary content for attention.

Fix. Widen the type scale between section headers, sub-heads and body. Use a clear visual anchor per section.

Resolving the trust-placement question

The instinct to move trust later (UX-1) and the instinct to show credibility early can both be right if we separate two different things. A thin credibility strip (one rating line + three logos) directly under the hero is good and is not what UX-1 warns against. The heavy trust block (review detail, instructor depth, full press row, contextualised stats) belongs after the parent understands the product. So: slim strip high, deep trust low.

Recommended homepage structure

- 1 Hero — outcome headline, primary CTA, one trust line
- 2 Thin credibility strip — rating + 3 logos
- 3 How It Works — three connected steps
- 4 Courses — cards with grade, level, age and outcome
- 5 What a class looks like — class preview
- 6 Student project showcase — real builds, grade-tagged
- 7 The teachers — top 1%, CS grads, background-checked
- 8 Why parents trust Codingal — full, contextualised trust
- 9 Pricing — transparent anchor + free trial + refund
- 10 FAQ — real parent objections answered
- 11 Final conversion — single CTA

Priority matrix

P1 — Critical (do first)

- Reorder: product before heavy proof (UX-1)
- Add a “what a class looks like” preview (UX-2)
- Put a pricing anchor on the page (UX-3)
- Richer course cards: level, age, outcome (UX-4)
- Restore + strengthen the project showcase (UI-2)
- Standardise CTAs (UX-7)

P2 — Important

- Rebuild FAQ around real parent objections (UX-5)
- Contextualise every statistic (UX-6)
- Deliberate dual-audience messaging (UX-8)
- Resolve trust placement: slim high, deep low

P3 — Enhancement

- Connected “How It Works” timeline (UX-9)
- Layout variety (UI-1)
- Logo row cleanup (UI-3)
- Stronger typographic hierarchy (UI-4)

Prepared by Oli & Hue (GhostBuild). This audit is the basis for the rebuilt Codingal homepage: every P1 finding above is addressed in the live rebuild.
